

Modern Web Development

Web development encompasses frontend, backend, and full-stack development for building websites and web applications.

Frontend frameworks like React, Vue, and Angular provide component-based architectures for building user interfaces.

CSS frameworks such as Tailwind CSS and Bootstrap enable rapid styling with utility classes and pre-built components.

Single-page applications (SPAs) load a single HTML page and dynamically update content using JavaScript and APIs.

Backend and APIs

Backend frameworks include Express.js, Django, FastAPI, and Ruby on Rails for server-side development.

RESTful APIs follow architectural constraints for building scalable and maintainable web services.

GraphQL provides a flexible query language that lets clients request exactly the data they need from the server.

Authentication strategies include JWT tokens, OAuth 2.0, and session-based authentication for securing web apps.
